

Deliverable 2

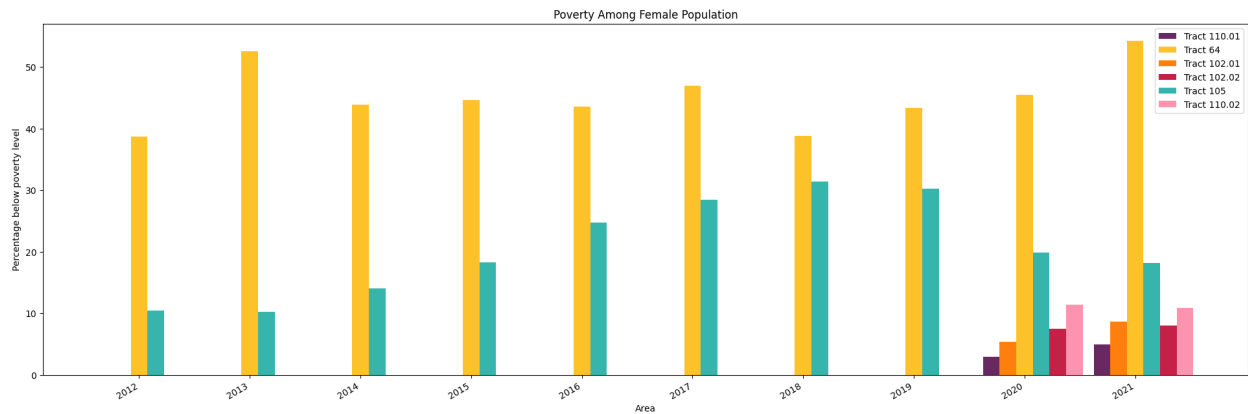

It is quite evident that poverty is more prevalent among part-time employees especially in Tract 64, 105 and 110.02. The difference is especially stark in tract 110.02, and the reason for this trend can be identified by further making a comparison of average wages provided.

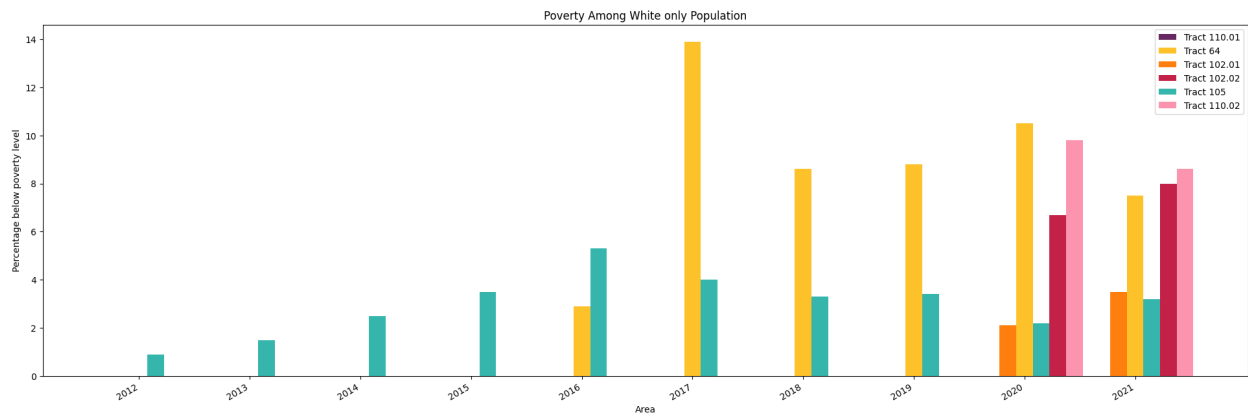

Percentage of poverty has clearly increased in Tract 64 among part time workers over the past 5 years.

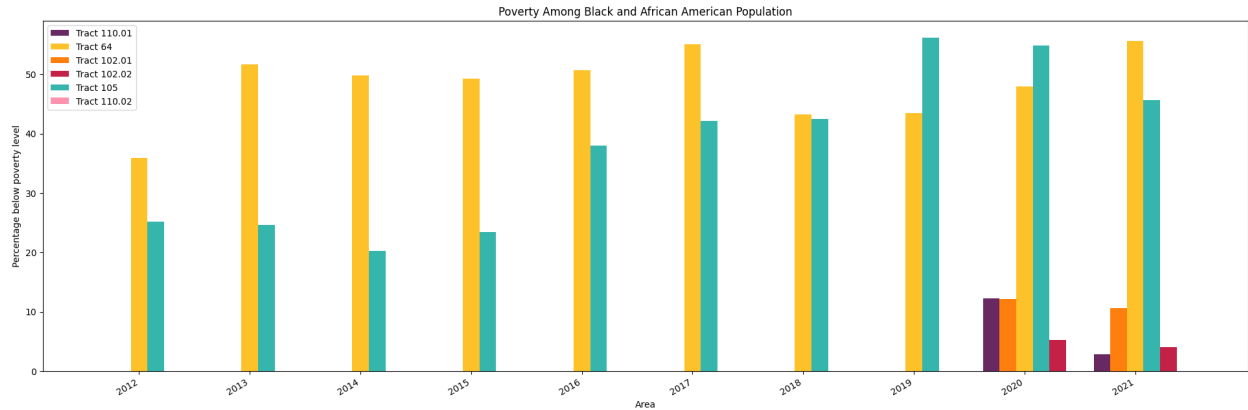

Our main focus should be on Tract 64 and Tract 105, as we lack sufficient data to draw conclusions about other tracts. In Tract 64, we observed that the poverty rate among males increased during the first six years, but it decreased in the last four years. However, the percentage values for Tract 64 are still concerning. In Tract 105, the poverty rate among males has only increased, which is a cause for concern.

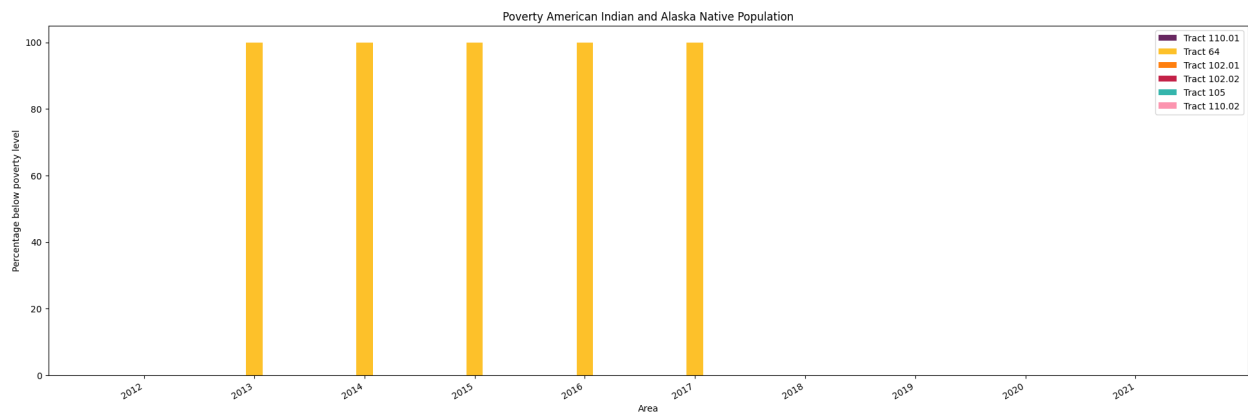

Tract 105 shows a positive trend with decreasing percentage values, while Tract 64 shows an increasing trend. However, when comparing the graphs of poverty rates among male and female populations across the years, the average percentage of poverty among females is consistently higher than males, especially in recent years.

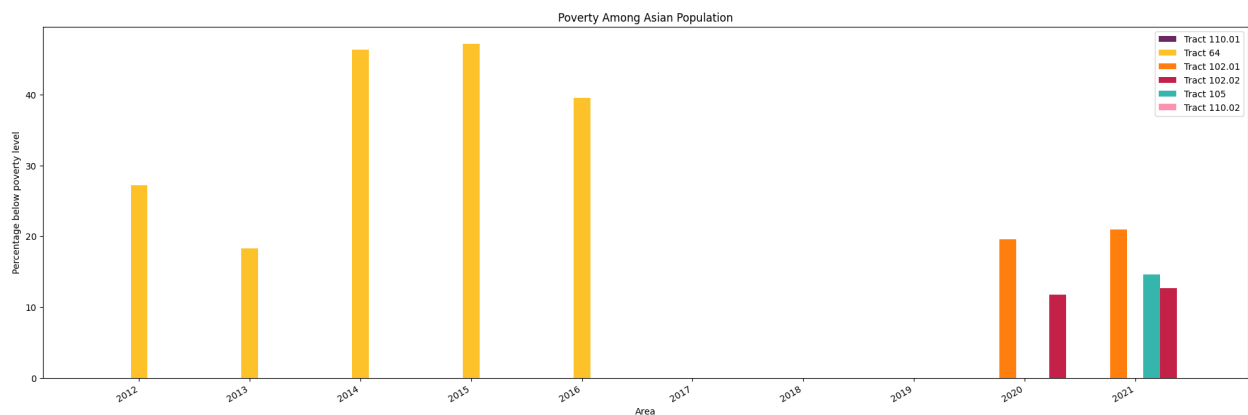

Poverty among white population is on the increase for Tract 64, 105, 102.02 and 110.02 which is not a good trend.

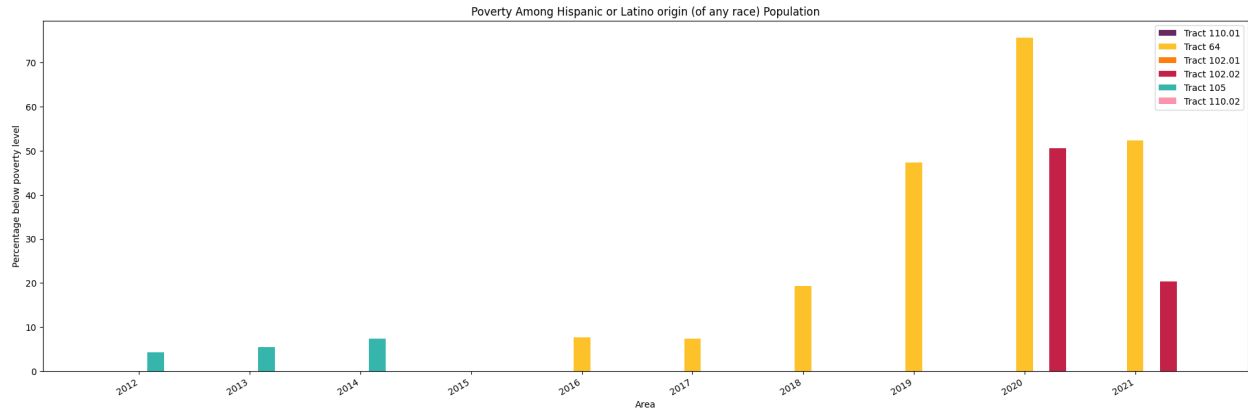

When comparing the graphs of poverty rates for Black or African American populations and White populations, a noticeable difference in rates becomes evident. The poverty percentage among Black and African American populations has consistently been much higher than the White population, particularly in Tract 64 and Tract 105. It is worrisome to note that the percentages have been increasing in recent years in both tracts.

We do not have sufficient data to make conclusions on this graph, but the statistics for Tract 64 looks extremely concerning.

Insufficient data seems to be an issue while analyzing the data on the Asian population as well, but we can see a general trend of high poverty levels in Tract 64.

It is evident that the poverty levels in Tract 64 and 102.02 have increased alarmingly from 2019 to 2020. However, in the last year, there has been a positive decrease in poverty levels.
